

Network Applications and Transport Services

Outline

- Context/overview
- Network application design principles
- Applications and protocols (Application Layer)
- Transporting application messages (Transport Layer)

Web and HTTP

First some jargon

- ❑ Web page consists of objects
- ❑ Object can be HTML file, JPEG image, Java applet, audio file,...
- ❑ Web page consists of base HTML-file which includes several referenced objects
- ❑ Each object is addressable by a URL
- ❑ Example URL:

`http://www.someschool.edu/someDept/pic.gif`

host name

path name

HTTP overview

HTTP: hypertext transfer protocol

- Web's application layer protocol
- client/server model
 - ❖ **client**: browser that requests, receives, "displays" Web objects
 - ❖ **server**: Web server sends objects in response to requests

HTTP overview (continued)

Uses TCP:

- ❑ client initiates TCP connection (creates socket) to server, port 80
- ❑ server accepts TCP connection from client
- ❑ HTTP messages (application-layer protocol messages) exchanged between browser (HTTP client) and Web server (HTTP server)
- ❑ TCP connection closed

HTTP is "stateless"

- ❑ server maintains no information about past client requests

Protocols that maintain "state" are complex! aside

- ❑ past history (state) must be maintained
- ❑ if server/client crashes, their views of "state" may be inconsistent, must be reconciled

HTTP connections

Nonpersistent HTTP

- ❑ At most one object is sent over a TCP connection.

Persistent HTTP

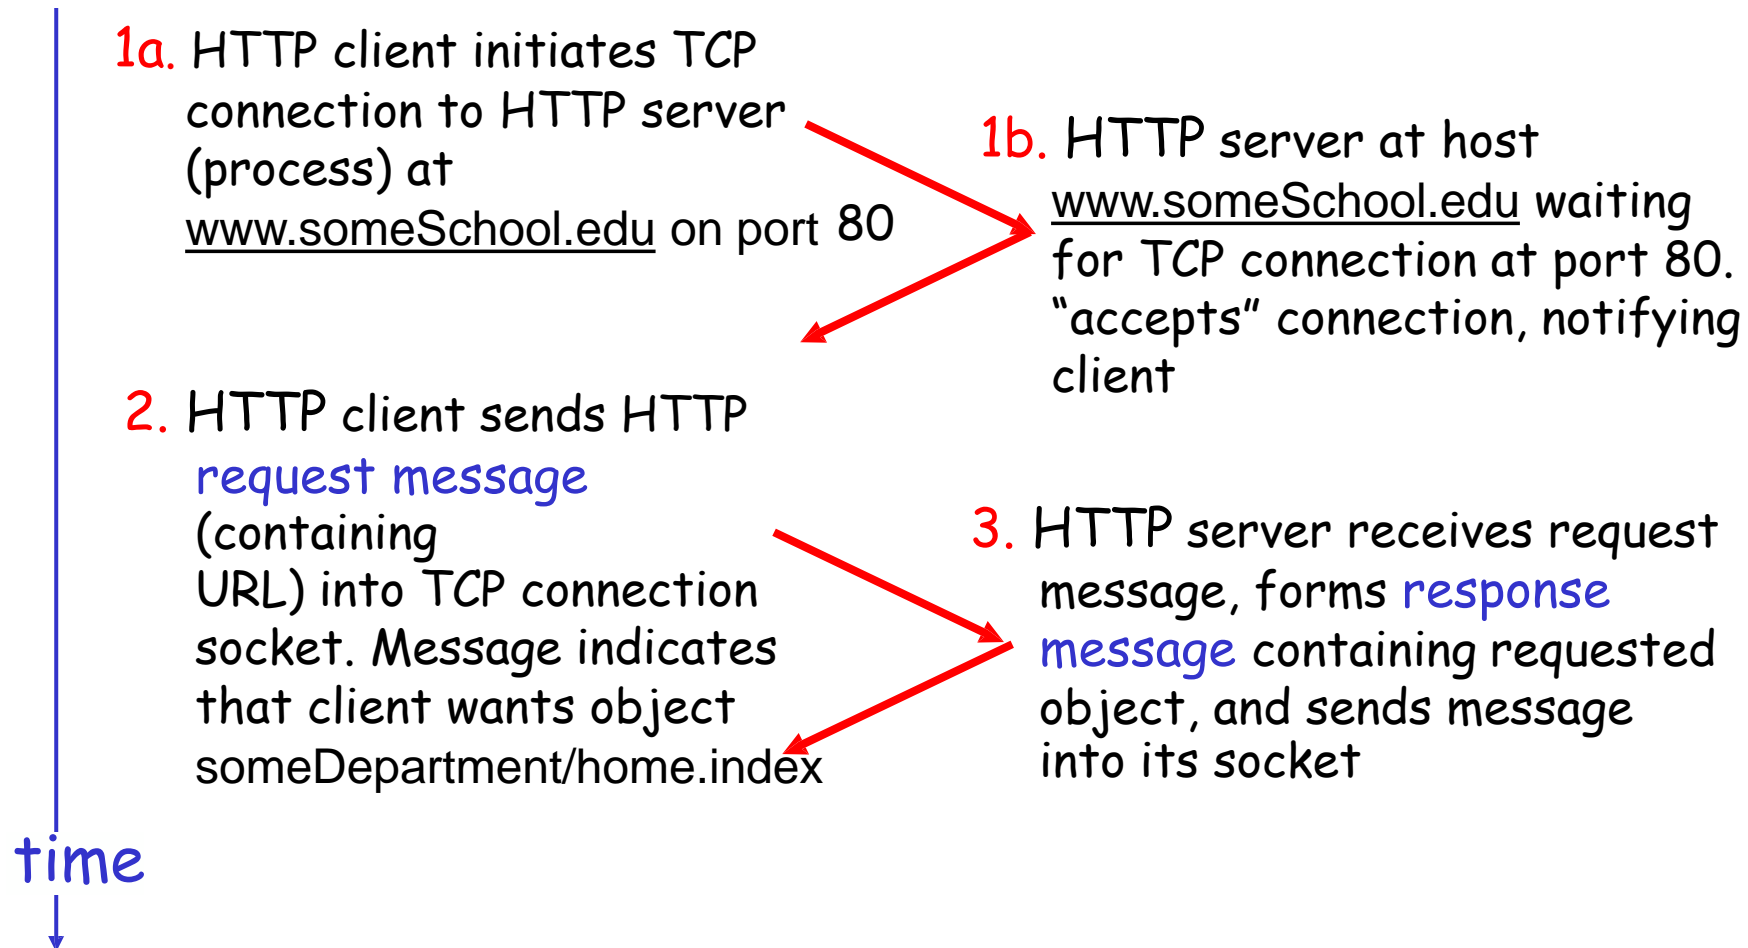

- ❑ Multiple objects can be sent over single TCP connection between client and server.

Nonpersistent HTTP

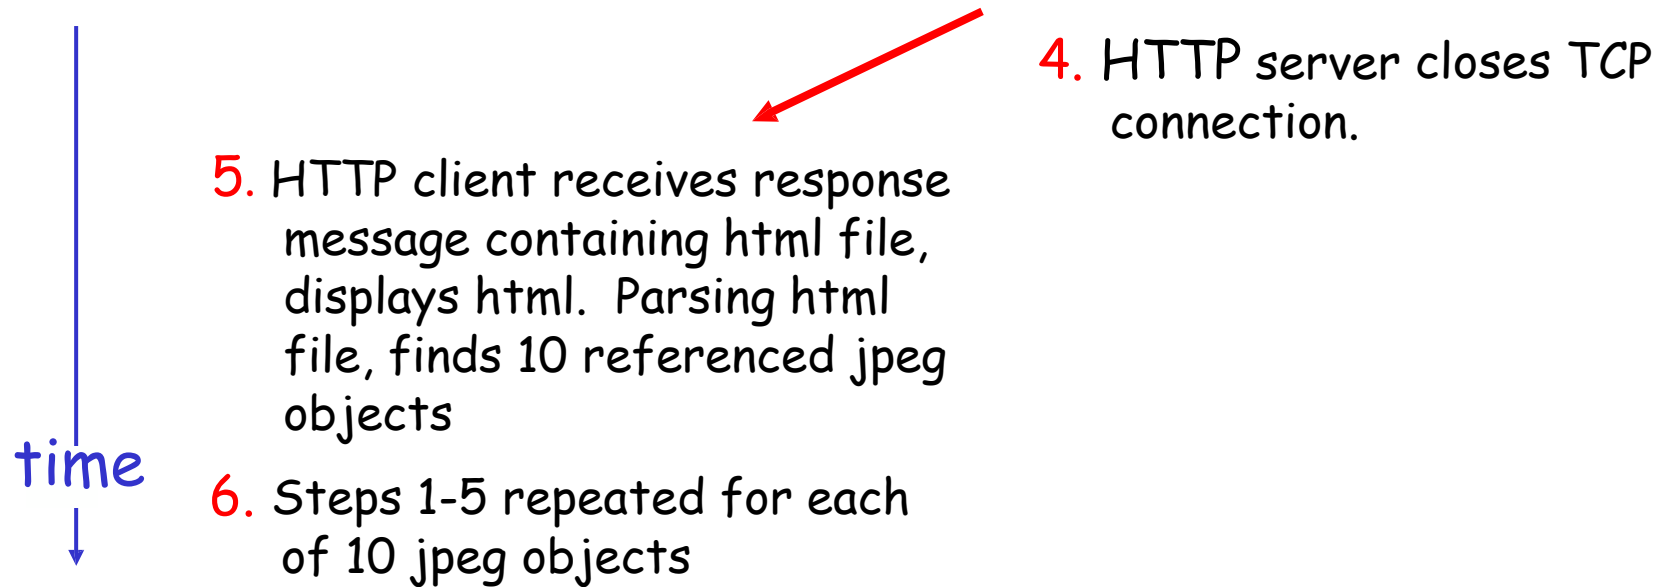

Suppose user enters URL

www.someSchool.edu/someDepartment/home.index

(contains text,
references to 10
jpeg images)

Nonpersistent HTTP (cont.)

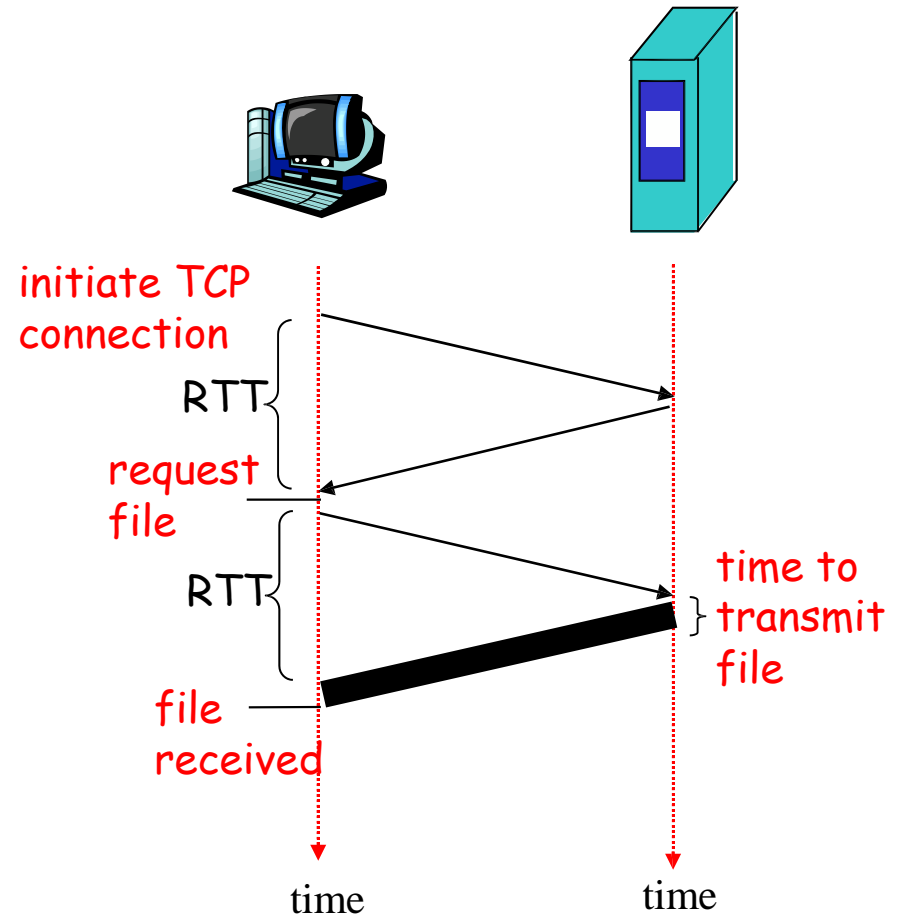

Non-Persistent HTTP: Response time

Definition of RTT: time for a small packet to travel from client to server and back.

Response time:

- ❑ one RTT to initiate TCP connection
- ❑ one RTT for HTTP request and first few bytes of HTTP response to return
- ❑ file transmission time

total = $2RTT + \text{transmit time}$

Persistent HTTP

Nonpersistent HTTP issues:

- ❑ requires 2 RTTs per object
- ❑ OS overhead for each TCP connection
- ❑ browsers often open parallel TCP connections to fetch referenced objects

Persistent HTTP

- ❑ server leaves connection open after sending response
- ❑ subsequent HTTP messages between same client/server sent over open connection
- ❑ client sends requests as soon as it encounters a referenced object, (without waiting for responses to the pending requests- "Pipelining")
- ❑ as little as one RTT for all the referenced objects

HTTP request message

- two types of HTTP messages: **request, response**
- **HTTP request message:**
 - ❖ ASCII (human-readable format)

request line
(GET, POST,
HEAD commands)

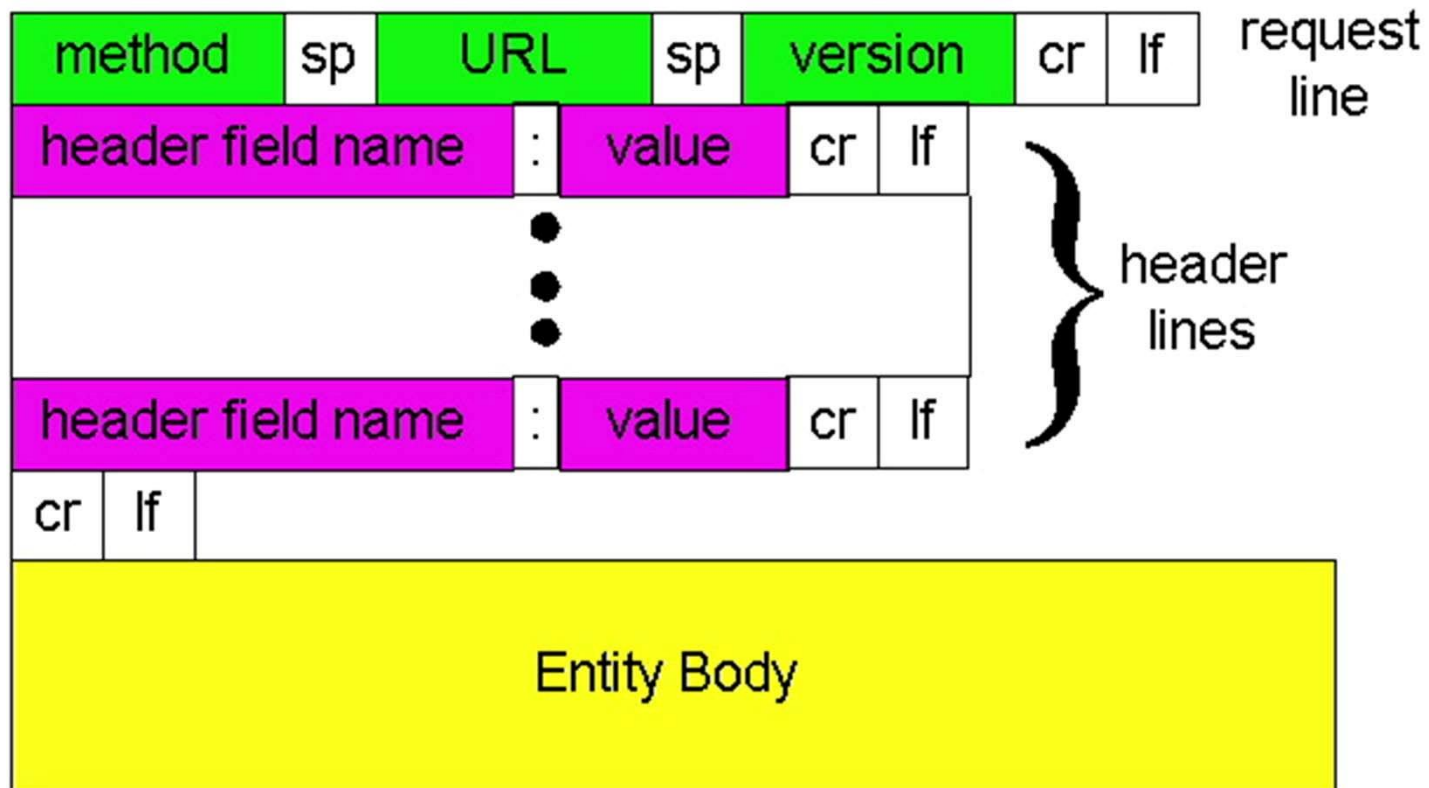

header
lines

carriage return,
line feed at start
of line indicates
end of header lines

```
GET /index.html HTTP/1.1\r\n
Host: www-net.cs.umass.edu\r\n
User-Agent: Firefox/3.6.10\r\n
Accept: text/html,application/xhtml+xml\r\n
Accept-Language: en-us,en;q=0.5\r\n
Accept-Encoding: gzip,deflate\r\n
Accept-Charset: ISO-8859-1,utf-8;q=0.7\r\n
Keep-Alive: 115\r\n
Connection: keep-alive\r\n
\r\n
```

carriage return character
line-feed character

HTTP request message: general format

Uploading form input

Post method:

- ❑ Web page often includes form input
- ❑ Input is uploaded to server in entity body

URL method:

- ❑ Uses GET method
- ❑ Input is uploaded in URL field of request line:

`www.somesite.com/animalsearch?monkeys&banana`

Method types

HTTP/1.0

- ❑ GET
- ❑ POST
- ❑ HEAD
 - ❖ asks server to leave requested object out of response

HTTP/1.1

- ❑ GET, POST, HEAD
- ❑ PUT
 - ❖ uploads file in entity body to path specified in URL field
- ❑ DELETE
 - ❖ deletes file specified in the URL field

- HTTP/1.0: Non-persistent
- HTTP/1.1: allows Persistent with pipelining but with the first-in-first-out (FIFO) limitation:
 - The server must send its responses in the same order that the requests were received — so the entire connection remains FIFO and head-of-line (HOL) blocking can occur.

- **HTTP/2** (2015, RFC 7540, developed from the earlier experimental SPDY protocol originally developed by Google)
 - Methods, status codes, header fields, and URIs: the same as HTTP/1.1
 - Decrease latency to improve page load speed in web browsers by considering:
 - Data compression of HTTP headers.
 - HTTP/2 Server Push:
 - Allows a web server to send resources to a web browser before the browser gets to request them. This avoids additional request cycle).
 - Pipelining of requests, without FIFO restrictions.
 - Fixing the head-of-line blocking problem in HTTP 1.x.
 - Multiplexing multiple requests over a single TCP connection.

HTTP response message

status line
(protocol
status code
status phrase)

header
lines

data, e.g.,
requested
HTML file

The diagram shows a red line starting from the 'status line' label, pointing to the first line of the message. From that point, a vertical red line descends, with a horizontal branch pointing to the 'header lines' label. The vertical line continues down to a horizontal branch pointing to the 'data' label.

```
HTTP/1.1 200 OK\r\n
Date: Sun, 26 Sep 2010 20:09:20 GMT\r\n
Server: Apache/2.0.52 (CentOS)\r\n
Last-Modified: Tue, 30 Oct 2007 17:00:02 GMT\r\n
ETag: "17dc6-a5c-bf716880"\r\n
Accept-Ranges: bytes\r\n
Content-Length: 2652\r\n
Keep-Alive: timeout=10, max=100\r\n
Connection: Keep-Alive\r\n
Content-Type: text/html; charset=ISO-8859-1\r\n
\r\n
data data data data data ...
```

HTTP response status codes

In first line in server->client response message.

A few sample codes:

200 OK

- ❖ request succeeded, requested object later in this message

301 Moved Permanently

- ❖ requested object moved, new location specified later in this message (Location:)

400 Bad Request

- ❖ request message not understood by server

404 Not Found

- ❖ requested document not found on this server

505 HTTP Version Not Supported

Trying out HTTP (client side) for yourself

1. Telnet to your favorite Web server:

```
telnet cis.poly.edu 80
```

Opens TCP connection to port 80
(default HTTP server port) at cis.poly.edu.
Anything typed in sent
to port 80 at cis.poly.edu

2. Type in a GET HTTP request:

```
GET /~ross/ HTTP/1.1  
Host: cis.poly.edu
```

By typing this in (hit carriage
return twice), you send
this minimal (but complete)
GET request to HTTP server

3. Look at response message sent by HTTP server!

User-server state: cookies

Many major Web sites
use cookies

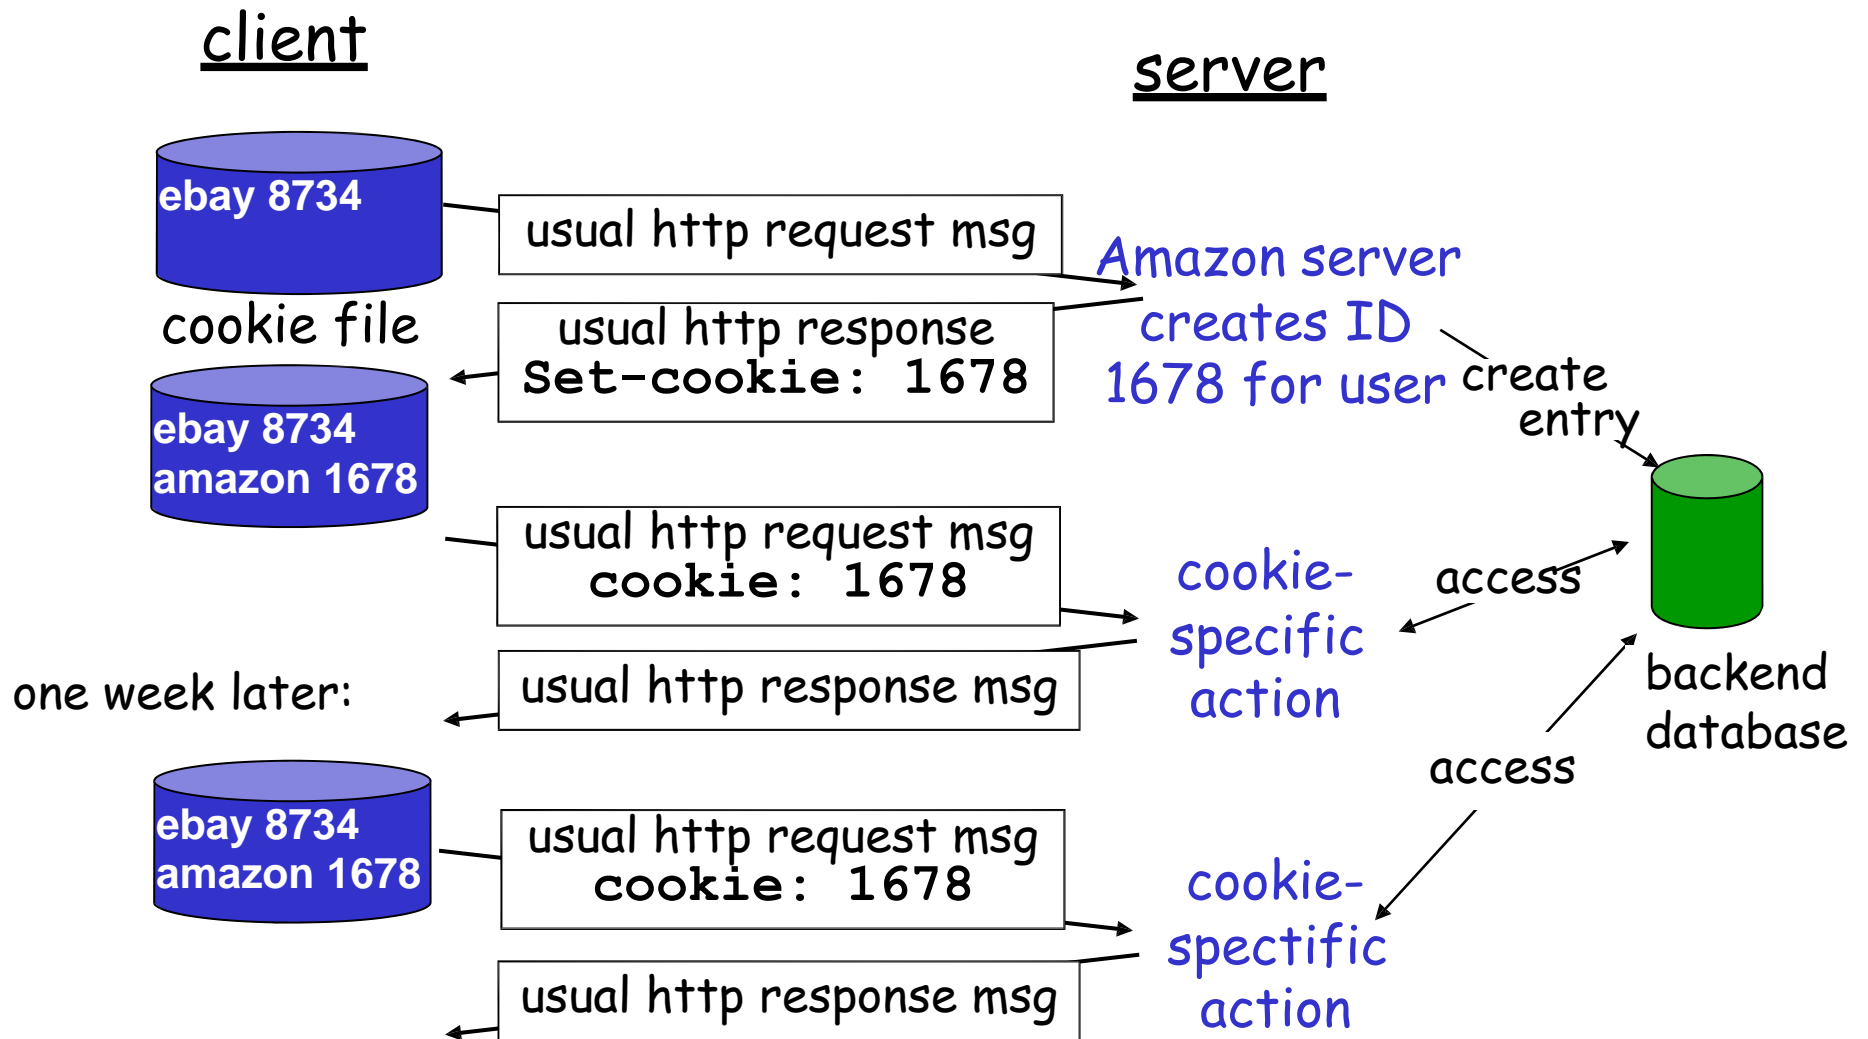

Four components:

- 1) cookie header line of HTTP response message
- 2) cookie header line in HTTP request message
- 3) cookie file kept on user's host, managed by user's browser
- 4) back-end database at Web site

Example:

- ❑ Susan always access Internet always from PC
- ❑ visits specific e-commerce site for first time
- ❑ when initial HTTP requests arrives at site, site creates:
 - ❖ unique ID
 - ❖ entry in backend database for ID

Cookies: keeping "state" (cont.)

Cookies (continued)

What cookies can bring:

- ☐ authorization
- ☐ shopping carts
- ☐ recommendations
- ☐ user session state
(Web e-mail)

How to keep "state":

- ☐ protocol endpoints: maintain state at sender/receiver over multiple transactions
- ☐ cookies: http messages carry state

aside

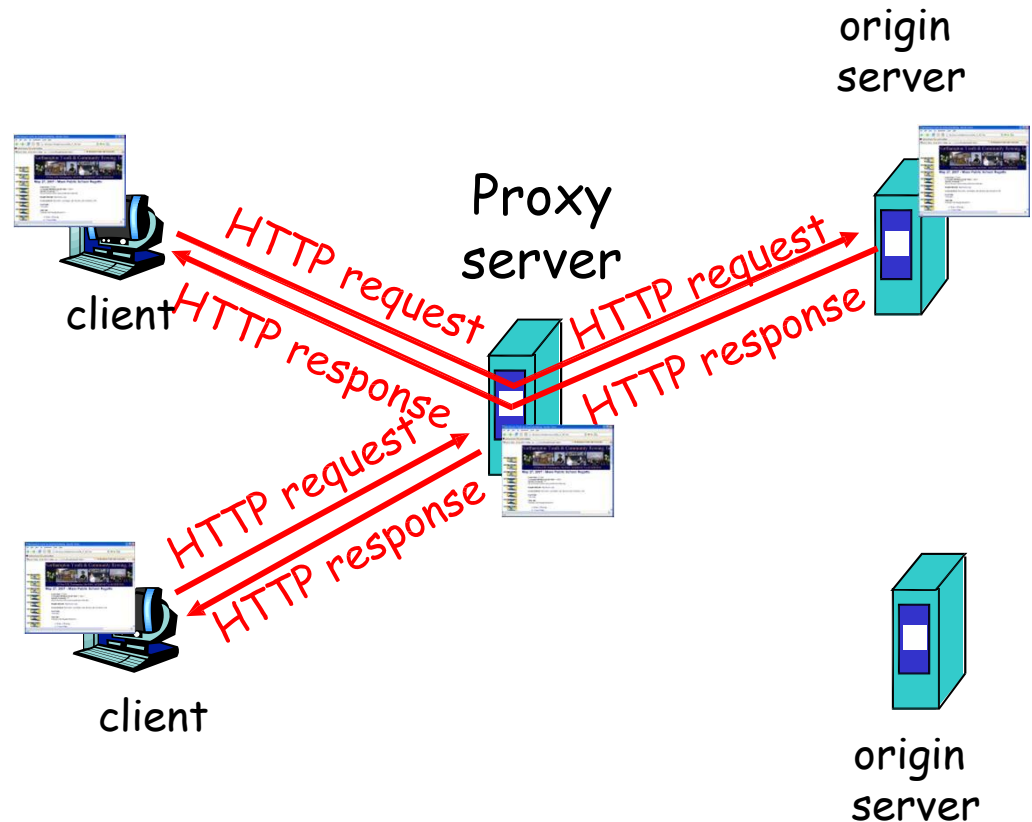

Cookies and privacy:

- ☐ cookies permit sites to learn a lot about you
- ☐ you may supply name and e-mail to sites

Web caches (proxy server)

Goal: satisfy client request without involving origin server

- user sets browser:
Web accesses via cache
- browser sends all HTTP requests to cache
 - ❖ object in cache: cache returns object
 - ❖ else cache requests object from origin server, then returns object to client

More about Web caching

- ❑ cache acts as both client and server
- ❑ typically cache is installed by ISP (university, company, residential ISP)

Why Web caching?

- ❑ reduce response time for client request
- ❑ reduce traffic on an institution's access link.
- ❑ Internet dense with caches: enables "poor" content providers to effectively deliver content (but so does P2P file sharing)

Caching example

Assumptions

- ❑ average object size = 100,000 bits
- ❑ avg. request rate from institution's browsers to origin servers = 15/sec
- ❑ delay from router in the Internet to any origin server and back to router = 2 sec

Consequences

- ❑ utilization on LAN = 15%
- ❑ utilization on access link = 100%
- ❑ total delay = Internet delay + access delay + LAN delay
= 2 sec + minutes + milliseconds

Caching example (cont)

possible solution

- ❑ increase bandwidth of access link to, say, 10 Mbps

consequence

- ❑ utilization on LAN = 15%
- ❑ utilization on access link = 15%
- ❑ Total delay = Internet delay + access delay + LAN delay
= 2 sec + msec + msec
- ❑ often a costly upgrade

Caching example (cont)

possible solution: install cache

- suppose hit rate is 0.4

consequence

- 40% requests will be satisfied almost immediately
- 60% requests satisfied by origin server
- origin server utilization of access link reduced to 60%, resulting in negligible delays (say 10 msec)

total avg delay = Internet delay + access delay + LAN delay
 $= .6 \cdot (2.01) \text{ secs} + .4 \cdot \text{milliseconds} < 1.4 \text{ secs}$

Conditional GET

- **Goal:** don't send object if cache has up-to-date cached version
- cache: specify date of cached copy in HTTP request
If-modified-since:
<date>
- server: response contains no object if cached copy is up-to-date:
HTTP/1.0 304 Not Modified

cache

server
